Grapher™ Registration Information

Your Grapher serial number is located on the CD cover or in the email download instructions, depending on how you purchased Grapher.

Register your Grapher serial number online at www.GoldenSoftware.com. Or, complete the Registration Form.PDF, located in the main directory of the installation CD. Return the Registration Form.PDF by mail or fax. This information will not be redistributed.

Registration entitles you to free technical support, free minor updates, and upgrade pricing on future Grapher releases. The serial number is required when you run Grapher the first time, contact technical support, or purchase Grapher upgrades.

For future reference, write your serial number on the line below.

Introduction to Grapher

Welcome to Grapher, the easy to use technical graphing package for scientists, engineers, business professionals, or anyone who needs to generate graphs quickly and easily.

Grapher is a sophisticated graphing program that transforms your data into any plot type you desire. Grapher creates over 60 different plot types, including 2D and 3D line, scatter, class scatter, bubble, step, function plots, and vector plots; 2D and 3D bar and floating bar charts; 2D and 3D histograms, pie charts, doughnut plots; box-whisker plots and Q-Q plots; polar line, scatter, class scatter, vector, function, bar, rose, and wind chart plots; ternary line, scatter, or class plots; stiff plots; high-low-close plots; radar plots; contour plots; and surface plots. Combine plot types to reveal information about your data. Add fit curves, confidence intervals, or display statistical information for your data. Grapher allows you to produce the finest publication quality graphs available.

Creating graphs is as easy as choosing the graph type, selecting the data file, and clicking the Open button. Grapher automatically selects reasonable default settings for each new graph. Changing the default settings for all future graphs is easy, allowing you to make the graph you want the first time, every time. All graphs allow quick and easy customization of all graph, axis, and plot settings. For example, you can change tick mark spacing, tick labels, axis title, axis length, grid lines, line colors, symbol styles, fill opacity, and more. You can add legends, images, fit curves, and drawing objects to the graph. You can import title blocks and company logos to create the final graph right in Grapher. To apply the same custom settings to several graphs, you can create a Grapher template containing the preferred styles. Once the graph is complete, you can export it in a variety of formats for use in all your presentations and publications.

The Scripter program, included with Grapher, is useful for creating, editing, and running script files that automate Grapher procedures. By writing and running script files, simple mundane tasks or complex system integration tasks can be performed precisely and repetitively without direct interaction. Grapher also supports Active X automation using any compatible client, such as Visual BASIC. These two automation capabilities allow Grapher to be used as a graph program for all your scientific, engineering, or business needs.

The script recorder records all commands as you make them in Grapher. When the script is run, Grapher performs the steps for you. This is ideal for users that need to perform repetitive tasks but are unfamiliar with automation, for advanced users who do not want to manually enter all of the syntax, or for average users having difficulty with syntax.
New features of **Grapher 11** are summarized:

- In the program: click the **Home | Help | Contents** command and click on the **New Features** page in the **Introduction** book

**System Requirements**

The minimum system requirements for **Grapher** are:

- Windows XP SP2 or higher, Vista, 7, 8, or higher
- 512 MB RAM minimum for simple data sets, 1 GB RAM recommended
- At least 500 MB of free disk space
- 1024 x 768 or higher monitor resolution with a minimum of 16-bit color depth

**Installation Directions**

Installing **Grapher 11** requires logging onto the computer with an account that has Administrator rights. Golden Software does not recommend installing **Grapher 11** over any previous version of **Grapher**. **Grapher 11** can coexist with older versions (i.e. **Grapher 10**) as long as they are installed in different directories, which is the default. For detailed installation directions, see the Readme.rtf file.

To install **Grapher** from a CD:

1. Insert the **Grapher** CD into the CD-ROM drive. The installation program automatically begins on most computers. If the installation does not begin automatically, double-click the Autorun.exe file located on the **Grapher** CD.
2. Click **Install Grapher** from the **Grapher Auto Setup** dialog to begin the installation.

To install **Grapher** from a download:

1. Download **Grapher** according to the directions you received.
2. Double-click on the downloaded file to begin the installation process.

**Updating Grapher**

To update **Grapher**, open the program and click the **File | Online | Check for Update** command. This will launch the Internet Update program which will check Golden Software's servers for any updates. If there is an update for your version of **Grapher** (i.e. **Grapher 11.0** to **Grapher 11.1**), you will be prompted to download the update.
Uninstalling Grapher

**Windows XP**: To uninstall Grapher, go to the *Windows Control Panel* and double-click *Add/Remove Programs*. Select *Grapher 11* from the list of installed applications. Click the *Remove* button to uninstall *Grapher 11*.

**Windows Vista**: To uninstall Grapher when using the *Regular Control Panel Home*, click the *Uninstall a program* link. Select *Grapher 11* from the list of installed applications. Click the *Uninstall* button to uninstall *Grapher 11*.

To uninstall Grapher when using the *Classic View Control Panel*, double-click *Programs and Features*. Select *Grapher 11* from the list of installed applications. Click the *Uninstall* button to uninstall *Grapher 11*.

**Windows 7**: To uninstall Grapher, go to the *Windows Control Panel* and click the *Uninstall a program* link. Select *Grapher 11* from the list of installed applications. Click the *Uninstall* button to uninstall *Grapher 11*.

**Windows 8**: From the *Start* screen, right-click the *Grapher 11* tile and click the *Uninstall* button at the bottom of the screen. Alternatively, right-click anywhere on the *Start* screen and click *All apps* at the bottom of the screen. Right-click the *Grapher 11* tile and click *Uninstall* at the bottom of the screen.

A Note about the Documentation

The Grapher documentation includes this quick start guide and the online help. General information is included in the quick start guide. Detailed information about each command and feature of Grapher is included in the online help. Click the *Home* or *Help* command or click the in the top right corner of the Grapher program to open the online help. In the event the information you need cannot be located in the online help, other sources of Grapher help include our support forum, knowledge base, FAQs, newsletters, blog, videos, and contacting our technical support engineers.

You can purchase the full PDF user’s guide that includes all of the documentation for the program. This PDF user’s guide can be printed by the user, if desired. The guide can be purchased on the Golden Software website at www.GoldenSoftware.com.

Various font styles are used throughout the Grapher documentation. Bold text indicates command names, dialog names, and page names. Italic text indicates item properties in the Property Manager or items within a dialog such as group names,
Grapher

options, and field names. For example, the **Save As** dialog contains a *Save as type* list. Bold and italic text also may be used occasionally for emphasis.

In addition, commands appear as **Home | Clipboard | Copy**. This means, "click or scroll to the **Home** tab at the top of the document, then click the **Copy** command in the **Clipboard** group." The first word is always the ribbon tab name, followed by the group name(s), and the last word is always the specific command.

**Three-Minute Tour**

We have included several example files with **Grapher** so that you can quickly see some of **Grapher's** capabilities. Only a few example files are discussed here, and these examples do not include all of **Grapher's** many plot types and features. The **Object Manager** is a good source of information as to what is included in each file.

**Example Grapher Files**

To view the example **Grapher** files:

1. Open **Grapher**.
2. Click the **File | Open** command.
3. Click on a .GRF file or .GPJ file located in the Samples folder. By default, the **Grapher** Samples folder is located in C:\Program Files\Golden Software\Grapher 11\Samples.
4. Click **Open** and the file opens.

**Line Scatter Plot.gpj**

The line scatter sample file contains a graph with multiple line/scatter plots. Some of the lines are filled, others are not. The file also contains multiple axes and an inserted company logo.

**Floating Bar Chart.grf**

The floating bar chart sample file contains a graph with a floating bar chart, dates, times, and events that need to be accomplished. The graph actually is two floating bar charts. The blue section shows the percent of each event that is complete. The gray section shows the entire amount of time allocated for each event. Axes display text and date labels.
Using Grapher
Graphs can be created in several ways in Grapher. These various methods allow you to create graphs in a manner most comfortable for you. The most common method of creating a graph is with the Graphs commands. For information on how to create a graph with the other methods, refer to the Creating Graphs section on page 19 in this quick start guide.

Creating Graphs in the Plot Window
To create a graph with the Graphs commands in the plot window:
1. In the plot window, click or scroll to the Graphs tab.
2. In the Create group, click the Basic, Bar, Polar, Specialty, Statistical, or Contour Surface button.
3. Click on the plot type you would like to create.
4. In the Open Worksheet dialog, select a data file and click the Open button. If you are creating a contour grid map or surface grid map, you are prompted for a .GRD file. If you are creating any type of function plot, you are not prompted for a data file.
5. The graph is created with the default properties. You can change the properties of any portion of the graph by clicking on the plot, axis, or graph and editing the properties in the Property Manager.
6. Click the File | Save command to save the file as a Grapher .GRF or .GPJ file.

The GPJ file format includes the data embedded in the Grapher file. This is a great format to use when sending graphs to other users. The GRF file format includes a link to the data. This format is good to use when the data will change periodically and the changed data updates the graph.

Using Scripter
Tasks can be automated in Grapher using Golden Software’s Scripter program or any ActiveX Automation-compatible client, such as visual BASIC. A script is a text file containing a series of instructions for execution when the script is run. You can do almost everything with a script that you can do manually with the mouse or from your keyboard. Scripts are useful for automating repetitive tasks and consolidating a sequence of steps. Scripter is installed in the same location as Grapher. Refer to the Grapher Automation help book in the online help for more information about Scripter. Several example scripts are included so you can quickly see Scripter’s capabilities.

Example Script Files
To run a sample script:
1. Open Scripter by navigating to the installation folder, C:\Program Files\Golden Software\Grapher 11\Scripter. Double-click on the Scripter.exe application file.
2. Click the File | Open command.
3. Select a sample script file .BAS in the C:\Program Files\Golden Software\Grapher 11\Samples\Scripts folder and click Open.
4. Click the Script | Run command and the script is executed.
5. Most sample scripts will open Grapher and display a graph in the plot window.

**Grapher User Interface**

*Grapher* contains four document window types: the plot window, worksheet window, Excel worksheet window, and grid window. Graphs and maps are displayed and edited in the plot window. The worksheet window displays, edits, transforms, and saves data in a tabular format. The Excel worksheet window allows a native Excel window to be opened in *Grapher*. The grid window allows viewing of various grid files. The *Grapher* user interface consists of the quick access toolbar, ribbon tabs and commands, tabbed windows managers, and status bar.

*This is the Grapher window with the Object Manager and Property Manager on the left side. The plot window, where the graph is displayed, is tabbed with a worksheet window and grid window. The ribbon bar is displayed at the top and the status bar is displayed at the bottom.*
The following table summarizes the function of the **Grapher** layout components.

<table>
<thead>
<tr>
<th><strong>Component Name</strong></th>
<th><strong>Component Function</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Title Bar</td>
<td>The title bar lists the program icon, the quick access toolbar, and the saved <strong>Grapher</strong> file name, if any. An asterisk (*) after the file name indicates the file has been modified since it was last saved.</td>
</tr>
<tr>
<td>Ribbon</td>
<td>The ribbon contains the tabs and commands used to run <strong>Grapher</strong>. The commands are unique to the plot document, worksheet document, and grid document.</td>
</tr>
<tr>
<td>Quick Access Toolbar</td>
<td>The quick access toolbar contains buttons that are always available in the program. This can be customized so that the buttons used most often are listed in the quick access toolbar.</td>
</tr>
<tr>
<td>Tabbed Windows</td>
<td>Multiple plot windows, worksheet windows, Excel windows, and grid windows are displayed as tabs. Click on the tab to display a window.</td>
</tr>
<tr>
<td>Plot Window</td>
<td>The plot window contains the graphs and other graphics. The plot window may also display worksheet data.</td>
</tr>
<tr>
<td>Status Bar</td>
<td>The status bar shows information about the activity in <strong>Grapher</strong>. The status bar is divided into three sections that contain information about the selected command, object, or position.</td>
</tr>
<tr>
<td>Object Manager</td>
<td>The <strong>Object Manager</strong> contains a hierarchical list of the objects in a <strong>Grapher</strong> plot window. These objects can be selected, arranged, and renamed in the <strong>Object Manager</strong>. The <strong>Object Manager</strong> is initially docked on the left side above the <strong>Property Manager</strong>.</td>
</tr>
<tr>
<td>Property Manager</td>
<td>The <strong>Property Manager</strong> allows you to edit any of the properties of a selected object. Multiple objects can be edited at the same time by selecting all of the objects and changing the shared properties.</td>
</tr>
<tr>
<td>Worksheet Manager</td>
<td>The <strong>Worksheet Manager</strong> contains a view of all data loaded in <strong>Grapher</strong>. Edits made in the <strong>Worksheet Manager</strong> to any worksheet are automatically reflected in the graph. Right-click in the <strong>Worksheet Manager</strong> to save, edit, transform, sort, or obtain statistics on cells.</td>
</tr>
<tr>
<td>Script Manager</td>
<td>The <strong>Script Manager</strong> controls scripts that are recorded and run within <strong>Grapher</strong>. Right-click in the <strong>Script Manager</strong> to see relevant menu commands for opening, saving, and running scripts.</td>
</tr>
</tbody>
</table>

**Grapher**

**Changing the Window Layout**
The managers display in a docked view by default; however, they can also be displayed as floating windows. The visibility, size, and position of each item may also be changed. Refer to the *Changing the Window Layout* topic in the online help for more information on layout options.

**Displaying Managers**
Check or uncheck the View | Display commands to show or hide the Object Manager, Property Manager, Worksheet Manager, or Script Manager. A check mark indicates the manager is visible. No check mark indicates the manager is hidden.

**Auto-Hiding Managers**
You can increase the plot document space by minimizing the managers with the Auto Hide feature. To hide the manager, click the button in the upper right corner of the manager. When the manager is hidden, place the cursor directly over the tab to display the manager again. Click the button to return the manager to docked mode.

**Docking Managers**
To dock the manager, click the title bar and drag the manager to a side of the Grapher window until the thick gray line indicates that the manager will attach to the side. Alternatively, double-click the manager’s title bar to toggle between floating and docked modes.

**Tabbing Managers**
To create tabbed managers:
1. Drag one manager on top of another window.
2. Hover over the title bar of the non-moving manager. The outline shows where the tabbed manager will display.
3. Release the mouse button.

To return to individual managers from the tabbed view:
1. Click on the manager’s name on the tab.
2. Drag the tab to a new position.
3. Click on the manager’s tab and drag the cursor to a new position to separate the managers.
**Customizing the Quick Access Toolbar**
You may customize **Grapher’s** quick access toolbar by right-clicking in the ribbon and clicking the **Customize Quick Access Toolbar** command. This is useful to create quick buttons to your favorite commands. Select the command from the left list in the dialog. Click *Add>>* and the button is added to the toolbar commands at the selected location. Existing commands can be removed by clicking on the command name from the right list in the dialog. Click *<<Remove* and the button is removed from the toolbar commands. Click *OK* to see the changes on the quick access toolbar.

**Customizing the Keyboard**
You may customize any keyboard command by right-clicking in the ribbon and clicking the **Customize Quick Access Toolbar** or **Customize the Ribbon** command. In the dialog, click the **Customize** button next to **Keyboard shortcuts**. Click on any command to select it. In the *Press new shortcut key*, press the key combination that should be assigned to this command and click *Assign*. Click *Close* and *OK* to make the changes.

**Customizing the Ribbon**
You may customize **Grapher’s** ribbon by right-clicking in the ribbon and clicking the **Customize the Ribbon** command. This is useful to turn off ribbon tabs that are not used, to create a custom tab that contains only the commands you want, or to rearrange groups on an existing tab.

To create a custom tab with any command on it, click the **File | Customize Ribbon** command. On the right side of the dialog, set the **Customize the Ribbon** option to **All Tabs** to see all tabs that exist on all document windows. Click in the desired section. Select **Main Tabs** if the new tab should be viewed across all document types, **Worksheet** if the tab should only appear in the worksheet, and **Plot** if the tab should only appear in a plot document. To create a new tab, click the **New Tab** button. To add groups to any tab, click the **New Group** button. To add commands to the new group, click on the command name on the left side of the dialog and click the **Add** button. Refer to the online help for additional information on customizing the ribbon.

**Minimizing the Ribbon**
Some users prefer to minimize the ribbon so that it does not take up as much space. To do this, right-click in the ribbon and click the **Minimize the Ribbon** command. The ribbon tabs minimize, showing only the tab names. To access any command, click the tab name and then click the command.
Plot Window
A plot window is the area used for creating and modifying graphs. When you first start Grapher, you are presented with an empty plot window. Multiple plot windows can be open at one time. Tabs can be used to easily move between multiple plot windows. If you need to change the display of tabs, click the File | Options command. Select Display on the left side of the dialog. Check or uncheck the Tabbed documents option on the right side of the dialog to turn tabs on and off.

Ribbon Bar Commands
The ribbon bar tabs contain commands that allow you to add, edit, and control the objects on the plot window page. See the Introduction help book in the online help for the Plot Window Commands help book that details the various plot window commands.

Status Bar
The status bar is located at the bottom of the window. Check or uncheck the View | Display | Status Bar command to show or hide the status bar. The status bar displays information about the current command or activity in Grapher. The status bar is divided into three sections. The left section shows the selected object name. If a menu command is selected, a brief description of the command appears in the left section. The middle section shows the cursor coordinates in inches or centimeters. The middle section also displays the graph’s X and Y coordinates when using the Graphs | Digitize commands, or when Display value on click is checked in the File | Options dialog. The right section displays the dimensions of the selected object.

Object Manager
The Object Manager contains a hierarchical list of the objects in a Grapher plot window. The objects can be selected, arranged, moved, renamed, or deleted in the Object Manager or through the plot window commands. Changes made in the Object Manager are reflected in the plot window, and vice versa.

Each item in the Object Manager list consists of an icon indicating the object type, a text label for the object, and a check box. A ✓ indicates that the object is visible. A □ indicates that the object is not visible. Click the check box to change the visibility of the item. Invisible objects do not appear in the plot window or on printed output.
If an object contains sub-objects, a ▼ or ▶ button displays to the left of the object name. Click on the ▼ or ▶ button to expand or collapse the list. For example, a graph object contains a plot, e.g., line/scatter plot, plus at least two axes. The Graph can contain many other objects. To expand the Graph 1 tree to see the axes and plots, click on the ▶ button next to Graph 1. To collapse the Graph 1 tree, click on the ▼ button next to Graph 1.

Click on the object name to select an object and display its properties in the Property Manager. The plot window updates to show the selected object with a selection bounding box and the status bar displays the name of the selected object. To select multiple objects in the Object Manager, hold down the CTRL key and click on each object.

To edit an object's text ID, select the object and then click again on the selected item (two slow clicks). You must allow enough time between the two clicks so it is not interpreted as a double-click. Enter the new name into the box. Alternatively, you can right-click on an object name and select Rename Object. Enter an ID in the Rename Object dialog and click OK.

To change the display order of the objects with the mouse, select an object and drag it to a new position in the list above or below an object at the same level in the tree. The cursor changes to a black arrow if the object can be moved to the cursor location or a red circle with a diagonal line if the object cannot be moved to the indicated location. For example, a line/scatter plot can be moved anywhere within its Graph object, to another Graph object, but not into a group object. In addition to dragging objects in the Object Manager, the order can be changed with the Arrange | Order | Move command.

To delete an object, select the object and press the DELETE key. Some objects cannot be deleted. For example, you cannot delete an axis that is currently in use by a plot in a graph.

**Property Manager**

The Property Manager allows you to edit the properties of an object, such as a line or axis. The Property Manager contains a list of all properties for a selected object. The Property Manager can be left open so the properties of selected objects are always visible. Information about the object properties is located in the online help.

Features with multiple options appear with a ▼ or ▶ button to the left of the name. To expand a section, click on the ▶ button. To collapse a section, click on the ▼ button. For example, click on a line/scatter plot to select it. In the Property Manager, click on the Plot tab. Click the ▶ next to Worksheet rows and you see three options: First
row, Last row, and Step factor.

To change a property, click on the property's value next to the property name. Select a new property from the pop up box, scroll to a new number using the buttons, select a new value using the , select a new value from the drop-down list, or type a property value. How a property is changed depends on the property type. For example, a rectangle has a Line Properties section that contains Style, Color, Opacity, and Width properties. Changing the Color, requires clicking on the current color and selecting a new color from the color palette. Changing the Opacity requires highlighting the existing percentage and typing a new number or clicking on the slider bar and dragging it to a new value. Changing the Width, requires highlighting the current width and typing a new number or scrolling to a new number.

You can modify more than one object at a time. Only shared properties are editable when multiple objects are selected. For example, click on X Axis 1 in the Object Manager. Hold the CTRL key down and click on Y Axis 1. You can change the common properties of each axis simultaneously in the Property Manager.

Occasionally, some properties are dependent on other selections. For example, on the Fill page, the Colormap option is disabled unless a Type other than None is selected.

Objects in the plot window automatically update after you select an item from a palette, press ENTER, or click somewhere else in the Property Manager.

When working with the Property Manager, the up and down ARROW keys on the keyboard move up and down in the Property Manager list. The TAB key activates the options for the highlighted property. The right ARROW key expands a collapsed section. The left ARROW key collapses a section.
Worksheet Manager

The WorksheetManager contains a view of all data loaded into Grapher. Multiple data files are displayed in a tabbed format. By default, the WorksheetManager appears at the bottom of the Grapher window below the plot window.

Right-click inside the WorksheetManager to open the worksheet menu commands. Use the NewGraph menu commands to create a graph in the current plot window. Use the Data menu commands to transform, sort, or generate statistics for the worksheet data.

Script Manager

The ScriptManager allows you to work with automation within Grapher rather than opening Golden Software's automation program, Scripter, separately. By default, the ScriptManager is closed. When opened, the default location is at the bottom of the Grapher window, tabbed with the WorksheetManager.

All of Scripter's toolbars, menus, etc. are available within the ScriptManager. To access the menu commands, right-click in the ScriptManager. Detailed information about Scripter, plus details about Grapher's automation objects, methods, and properties are located in the online help. Open the automation help by clicking the Developer | Help | Automation command in the Grapher program.

Sample scripts can be found in the Scripts folder, located in the Grapher installation folder. By default, the Scripts folder is located at C:\Program Files\Golden Software\Grapher 11\Samples\Scripts. If your version of Grapher was installed elsewhere, look in that installation folder. The Scripts folder has a variety of .BAS script files ready for you to use. Sample scripts can also be downloaded from www.GoldenSoftware.com.

The Script Recorder is a great way to use scripting and become familiar with automation. Complete Lesson 8 - Working with the Script Recorder section on page 39 in this quick start guide to practice using the Script Recorder.
Worksheet Window

To enter data in a worksheet, use the **File | Open** command to open an existing data file or click the **File | New | Worksheet** command to create a new blank worksheet. Data already used to create plots can be opened in the worksheet window with the **Graphs | Worksheet | Display** command.

The components of the worksheet window shown above are described in the table below.

<table>
<thead>
<tr>
<th>Component Name</th>
<th>Component Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Letters</td>
<td>The column letters identify a column of the worksheet.</td>
</tr>
<tr>
<td>Row Numbers</td>
<td>The row numbers identify a row of the worksheet.</td>
</tr>
<tr>
<td>Active Cell</td>
<td>The cell highlighted with a bold outline. The active cell receives data input (numeric values or text strings) from the keyboard. Only one cell is active at a time.</td>
</tr>
<tr>
<td>Active Cell Location</td>
<td>The location of the active cell is indicated with the column letter and row number (i.e. B4).</td>
</tr>
<tr>
<td>Active Cell Edit Box</td>
<td>The box displaying the data or text contained in the active cell. Data typed into an empty cell appears in both the edit box and the active cell.</td>
</tr>
<tr>
<td>Worksheet Name</td>
<td>The data file name of the worksheet or the worksheet number prior to saving is displayed on the tab.</td>
</tr>
<tr>
<td>Select Entire Worksheet Button</td>
<td>This button selects all cells in the worksheet.</td>
</tr>
</tbody>
</table>

See the *Worksheet Window Commands* help book, located in the *Introduction* help book in the online help for detailed information on the worksheet commands.
File Types
Several file types are used in **Grapher**.

Grapher Files
There are three types of **Grapher** files: **Grapher** .GRF, .GPJ, and .GRT files.

**Grapher** .GRF Files
**Grapher** .GRF files contain all of the information necessary to reproduce the graph, except for the data. When you save a **Grapher** file, all the scaling, formatting, and parameters for the graph are preserved in the file. **Grapher** .GRF files save a link to the data and do not store the data internally in the file. For example, if a .GRF file needs to be sent to a colleague, you would need to send the data file(s) used to create the graph, in addition to the .GRF file. This format is preferred for graphs where the data changes and needs to link to the external source data file.

**Grapher** .GPJ Project Files
**Grapher** .GPJ files store all of the information necessary to reproduce the graph, including embedding the data. All scaling, formatting, and parameters for the graph are preserved in the file. If a .GPJ file needs to be sent to a colleague, you would only need to send the .GPJ file. This format is preferred when you want to have the data and the graph contained in a single file and the data does not change often.

**Grapher** .GRT Template Files
**Grapher** .GRT files are used to create a template with set graphing preferences. A saved template file does not contain a reference to a specific data file. This means that once the template graph is created, you can use the template with any data set. You can use the template to set options such as the number of decimal places on axis tick mark labels, label angles, axis labels, graph titles, line plot colors, fill colors, symbol size, or any other graphing option. If a .GRT file is sent to a colleague, they can use their own data set with the file to create a graph based on the specifications in the template file. This format is preferred when the layout of the graph needs to remain consistent with a variety of similarly formatted data files.

Data Files
In most cases, there is a prompt for a data file when you create a graph in **Grapher**. Data files can be imported from a variety of sources, such as ASCII text files, Excel files, or database files. Data can be entered directly into **Grapher’s** worksheet if the files do not already exist.
The data to be represented on a plot needs to be in column and row format. Each row is assigned to a single point on most plots. The columns contain the different variables to be represented on the plot. Some of the most commonly used data types are described in the following sections.

**ASCII Data**

ASCII files are generic format files that can be read or produced by most applications. There are three common ASCII data formats: .DAT, .CSV, and .TXT. These files can also be imported into most applications, including word processors, spreadsheets, and ASCII editors. The files differ in the types of delimiters, or column separators, between the data. ASCII files do not contain any worksheet formatting information such as row height, column width, or cell formatting. This format does not have a limitation on the number of rows or columns.

**Excel Files**

Microsoft Excel .XLS, .XLSX, and .XLSM files contain data and retain some cell formatting in Grapher. Some information, such as formulas, is ignored. Excel files can preserve all formatting information available in the Golden Software worksheet. An Excel 2003 .XLS worksheet has a 65,536-row limit and a 256-column limit; therefore, this format cannot be used to store very large data sets. An Excel 2007 .XLSX worksheet has a 1,048,576 row limit and a 16,384 column limit.

**Use Caution when Saving Excel Files!**

A file can be saved in an Excel .XLS or .XLSX format from Grapher, but only one worksheet can be saved. Grapher does not allow for saving multiple worksheets in a single Excel document. If a multi-worksheet Excel file is open and saved from the Grapher, be aware that only a single worksheet is saved in the document. If the existing file is overwritten, all the other worksheets are destroyed. In this case, a warning message is issued.

**Retaining Excel Information**

To save all the formatting, formulas, and worksheets in an .XLS or .XLSX file, you can use Excel directly in Grapher. Use the File | Open Excel command to utilize all of Excel’s features and create graphs in Grapher. Excel disables the save command, so you can only use the Save As command and save to a new .XLS or .XLSX file.

**Database Files**

In Grapher, graphs can be created from Access .ACCDB and .MDB files and dBase .DBF files directly without first converting to a new worksheet. A graph is created directly from the database file and will reference the database. Changes made in the database table will automatically update the graph.
Quick Start Guide

Other database formats can be imported into Grapher’s worksheet. Click the File | Open command. In the Open dialog, click the Database button. Step through the dialogs to import the file and the database is converted into a worksheet format. These files cannot be saved in their native format, but you can save the files in any of the available worksheet formats by clicking the File | Save As command.

Grid Files

Grid files are used to produce contour and surface grid-based maps in Grapher. Grid files contain a regularly spaced rectangular array of Z values organized in columns and rows. Grid files can be imported from a wide variety of sources. For example, the contour grid map.GPJ sample file uses a Surfer .GRD file to create a contour XY grid map.

Plot Types

Several different 2D and 3D plot types can be created with Grapher. The Graphs menu includes Basic, Bar, Polar, Specialty, Statistical, and Contour Surface. Detailed information about each plot type and an example graphic is located in the online help in the Introduction book on the Plot Types page.

You can combine multiple plots in a single graph. A graph can contain as many axes and plots as needed to display your data.

Basic Plots

Basic plots include 2D line plots, scatter plots, line/scatter plots, step plots, function plots, bubble plots, and class plots. In most cases, two variables are displayed on two axes. The Basic plots also include ribbon plots, wall plots, ribbon step plots, and function plots with a 3D aspect. In these cases, two variables are displayed with a 3D view. Basic plots also include XYZ line/scatter plot, bubble plots, and class plots. These are true 3D plots, using at least three variables and three axes.

Bar Plots

Bar plots include 2D and 3D horizontal and vertical bar charts and floating bar charts. In 2D cases, two variables are displayed on two axes. In 3D, either two variables are displayed with a 3D aspect or three variables are displayed on three axes. 2D bar charts can also be created directly from category data.
Grapher

**Polar Plots**

Polar plots include polar line plots, scatter plots, line/scatter plots, class plots, vector plots, function plots, bar charts, rose charts, wind charts, and radar charts. Data are positioned on a circular plot at an angle and a specified distance away from the center location.

---

**Specialty Plots**

Specialty plots include high-low-close plots; candlestick plots; ternary line plots, scatter plots, line/scatter plots, and class plots; 2D and 3D vector plots; and stiff plots.

High-low-close and candlestick plots display at least three variables on two axes. All ternary plots display three variables on three axes, arranged in a triangle display. Vector plots display four or six variables on two or three axes. Vectors can be displayed between two points (XYXY and XYZ-XYZ plot types) or from a starting point to another point (XYAM and XYZ-dx, dy, dz plot types).

---

**Statistical Plots**

Statistical plots include 2D and 3D vertical and horizontal histograms, box-whisker plots, notched box-whisker plots, 2D and 3D pie charts, Q-Q plots, normal Q-Q plots, and 2D and 3D doughnut plots.

Histograms read raw data and count the number of instances in each bin, creating a frequency of each data count. Pie charts display data as percentages of a whole. Doughnut plots are similar to pie charts, but can be stacked and have a hole in the center. Box-whisker plots and notched box-whisker plots display median, quartile, and outliers for a data set. Q-Q plots and normal Q-Q plots display a data set compared to another data set or to the normal distribution.

---

**Contour Surface Plots**

Contour maps include contour data maps, grid maps, and function maps. Contour maps are 2D representations of three variables. The contour line defines the equal Z values across the map. Contour maps can be displayed with an XY or XZ orientation. Surface Maps include surface data maps, grid maps, and function maps. Surface maps are 3D color representations of three variables.
Creating Graphs
Graphs can be created using the **Graphs** commands, the **Graph Wizard** dialog, and from templates.

Creating Graphs with the Graphs Create Commands
The most common method of creating graphs is to use the **Graphs** menu **Create** commands. This method is discussed in the *Three-Minute Tour* section on page 4 of this quick start guide.

Creating Graphs with the Graphs Create Commands in a Worksheet
If you are working with data in the worksheet, you can create a graph without switching to the plot window. Simply select the columns you wish to plot and choose the plot type you wish to create.

To create a graph from the worksheet:
1. Open a data file by clicking the **File | Open** command.
2. Select a data file in the **Open** dialog and click the **Open** button.
3. Highlight the columns to use in the plot.
4. Click or scroll to the **Graphs** tab.
5. Select the plot type you would like to create and the graph is created with the default plot properties in a new plot window.
6. You can change the properties of a selected graph, plot, or axis through the **Property Manager**.

If you are working with the data in the **Worksheet Manager**, right-click anywhere in the window and select the **New Graph** menu command in step 4.

Creating Graphs with the Graph Wizard
The graph wizard leads you through the necessary steps to create a new graph or add a plot to an existing graph. This is often the simplest way to make a graph if you are not familiar with **Grapher** or if you want to change some portion of the graph before it is created. You can set some of the plot features through the wizard, although most plot parameters use the default settings to create the graph.

To create a graph with the graph wizard:
1. In the plot window, click the **Graphs | Create | Wizard** command.
2. In the **Graph Wizard** dialog, select the plot type from the **Plot Categories** list.
3. Select a specific plot from the Plot Types section. A description of the selected plot type is listed in the Description section.

4. If you want to create a new graph, select New graph next to Add plot to at the bottom of the dialog. If you want to add a curve to an existing graph, select the graph name next to Add plot to.

5. Check the box next to Display preview, if a plot preview of the data is desired.

6. Click the Next button.

7. In the Open Worksheet dialog, choose a new data file to open, or click on a previously opened data file in the Open worksheets list. Click the Open button.

8. In the Graph Wizard dialog, set the plot, line, and fill properties. You can review the plot properties and see the Plot Preview if the Display preview option is checked.

9. If the plot does not appear the way you want, click the Back button to make changes. If the settings are acceptable, click the Finish button to create the graph. The graph is created with the specified properties.

10. Additional plot, axis, and graph properties can be changed by clicking on the appropriate object in the Object Manager and changing the properties in the Property Manager.

Creating Graphs from a Template File

Template graphs are used to set graphing preferences in Grapher. When a template file is saved, it does not contain a reference to any data file. This means that once the template file is created, it can be used to create a graph with any data set.

To Create a Template

1. In a plot window, design the graph exactly the way you want the final graph to appear. Create any plot type, set the axes properties, add titles, format legends, import company logos, set background properties, add text, etc.

2. Click the File | Save As command.

3. In the Save As dialog, specify a Save in location, a File name, and choose Plot Template (*.grt) for the Save as type. Click the Save button to save the completed template file.

To Create a Plot From a Template

1. Click the File | New | Plot from Template command or click the File | Open command.

2. In the Open dialog, select a .GRT template file, and click the Open button.

3. If prompted, select a data file to use with the template.

4. Check the Use this worksheet for remaining items if all the plots in a template use
the same worksheet.
5. Check the *Set columns* if you want to change the column specifications for individual plots in the graph.
6. Click the *Open* button and the new plot is created.

**Automation**

*Grapher* operations can be controlled through automation scripts. You can do almost everything with a script that you can do manually with the mouse or from the keyboard. Scripts are used to automate repetitive tasks, consolidate a complicated sequence of steps, or act as a "front end" to help novice users access *Grapher's* capabilities without having to become familiar with *Grapher*. Since *Grapher* exposes its services through automation, you can use any programming tool that accesses automation objects. Such tools include Visual BASIC, Windows Scripting Host, and many of the Microsoft Office applications, among others.

**Scripter**

Golden Software's *Scripter* is a program for developing and running scripts. A script is a text file containing a series of instructions carried out when the script is run. Instructions are written in a Visual BASIC-like programming language. *Scripter* offers many features to help you write, edit, and debug scripts. Its features include language syntax coloring, a list of the procedures defined in the script, an object browser for examining procedures available in external objects, a visual dialog editor, break points, single-step execution (including options to step over and to step out of procedures), a watch window for displaying the values of script variables, and more.

To start the *Scripter* program, select it from the Windows Start menu. *Scripter* is installed in the same program group as *Grapher 11*. To open *Scripter*, click the Windows Start button and locate *Golden Software Grapher 11 | Scripter*. If *Scripter* is not present, the installation of *Scripter* may have been skipped when *Grapher* was installed. See the *Readme.rtf* file for information about the installation process.

Once *Scripter* is open, open a script file with the **File | Open** command. In the **Open** dialog, select any .BAS file and click **Open**. Execute the script by clicking the **Script | Run** command.

**Script Recorder**

*Grapher 11* includes a *Script Recorder*, accessed through the **Developer** tab commands. The *Script Recorder* records each process as you do it in *Grapher*. The script can be saved for later use. When the script is run, *Grapher* performs all the recorded steps for you. This is ideal for users who need to perform repetitive tasks but
Grapher

are unfamiliar with automation, for advanced users who do not want to manually enter all of the syntax, or for average users who have difficulties with syntax. Open the Script Manager by checking the View | Display | Script Manager command, if you would like to view a script while it is recording. Recording must be stopped before you can edit scripts in the Script Manager.

Script Recorder Exercise

To record a script:

1. Click the Developer | Recorder | Record command. The Record button changes to a red circle with the word Stop next to it to indicate recording mode.
2. Click the Draw | Ellipse command.
3. Left-click anywhere in the plot window, hold the left mouse button down, drag the mouse to create an ellipse, and release the mouse button to finalize the ellipse.
4. Hold down the CTRL button on the keyboard and repeat step 3 to draw a circle.
5. Press the ESC button on the keyboard to exit draw mode.
6. Select Ellipse 1 in the Object Manager.
7. In the Property Manager, click on the Line tab.
8. Change the Color of the line from Black to Blue.
9. Click the Developer | Recorder | Stop command.
10. In the Save As dialog, select a File name and click the Save button. Your script is now saved and ready to use.

To run a script:

1. Click the Developer | Recorder | Run command.
2. Select the desired script .BAS file and click Open.
3. The script runs to completion and any graphs are created by the script.
Tutorial

The tutorial is designed to introduce you to some of Grapher's basic features and should take less than an hour to complete. After you have completed the tutorial, you will have the skills needed to begin creating your own graphs with your own data. The tutorial can be accessed in the program using the Home | Help | Tutorial command.

Tutorial Lesson Overview

The following is an overview of lessons included in the tutorial.

- **Lesson 1 - Viewing and Creating Data** opens and edits an existing data file and creates a new data file.
- **Lesson 2 - Creating a Graph** shows you one way to create a graph.
- **Lesson 3 - Modifying Plot Properties** shows you how to open and edit the plot properties.
- **Lesson 4 - Editing Axes** shows you how to add an axis title, how to change the tick mark spacing, and how to change the tick label source.
- **Lesson 5 - Adding Additional Plots to the Graph** shows you how to add a second plot to an existing graph.
- **Lesson 6 - Editing Graph Properties** shows you how to edit properties of the graph, such as adding a graph title.
- **Lesson 7 - Adding and Editing a Legend** shows you how to create and edit a legend.
- **Lesson 8 - Working with the Script Recorder** shows you how to use the Script Recorder with the techniques in the previous lessons and adds a few new items. This is an optional advanced lesson. Because other features are covered in this advanced lesson, it is highly encouraged that you complete Lesson 8, even if you do not wish to use the script recorder.

The lessons should be completed in order; however, they do not need to be completed at one time. Advanced lessons are available in Grapher by clicking the Home | Help | Tutorial command. These lessons are optional, but we encourage you to read through them as they provide additional detailed knowledge about Grapher’s features.

Using the Tutorial with the Demo Version

Some Grapher features are disabled in the demo version, which means that some steps, such as saving a graph or script, cannot be completed by users running the demo version. This is noted in the tutorial lessons.
Starting Grapher
To begin a Grapher session:
1. Navigate to the installation folder, which is C:\Program Files\Golden Software\Grapher 11 by default.
3. Select the type of document to create in the Welcome dialog. For the tutorial, select New Plot.
4. A new empty plot window opens in Grapher. This is the work area for producing graphs.

If this is the first time that you have opened Grapher, you will be prompted for your serial number before step 3. Your serial number is located on the CD cover, or in the email download instructions, depending on how you purchased Grapher. Once input, you may access your serial number at any time by clicking File | About Grapher in the Grapher window.

If you already have been working with Grapher, open a new plot window by clicking the File | New | Plot command, clicking the button on the quick access toolbar, or pressing CTRL+N on the keyboard.

Lesson 1 - Viewing and Editing Data
A data file is a file containing columns of data values. At minimum, two columns are required to create most 2D graphs in Grapher. Data files can contain header information, labels, point identifiers, filter information, and multiple columns of data. As such, it is often a good idea to examine the data file contents before creating your graph.

Opening an Existing Data File
If you would like to view or edit data, you can open the data file in Grapher. There are several ways to view a data file. If a graph has already been created, the most common method to view the data is to use the Worksheet Manager. If a graph is not yet created, you can open the data in the worksheet window.

1. Click the File | Open command, click the button on the quick access toolbar, or press CTRL+O on the keyboard. The Open dialog displays.
2. If you are not in the Samples folder, browse to it. The Samples directory is located at C:\Program Files\Golden Software\Grapher 11\Samples, by default. In the list of files, click Tutorial.dat.
3. Click the Open button to display the data in the worksheet window.
Notice that there are several columns of data. Column A contains Month number data. Columns B through I contain site information. Column J contains an abbreviation of month names. Row 1 contains header text, which is helpful for identifying which column contains which data. When a header row exists, the information in the header row is used in the Property Manager when selecting worksheet columns.

Editing Data
To edit any value, click in the cell to select it. Type information and the existing value is overwritten. Data can be sorted, transformed, or transposed in this window. You can also calculate statistics for the worksheet data in this window. New columns or rows can also be added. For instance, if we noticed that the value in cell B2 was incorrect, we could change it.

1. Click in cell B2.
2. Type the value 47.2.
3. Press ENTER on the keyboard.
4. After making changes to the worksheet, the file can be saved by clicking the File | Save command. Data cannot be saved in the demo version.
**Calculating Statistics on the Data**

Sometimes, it is necessary to know some basic statistical information about the data. For instance, with this data, what is the high value for each site and how do the average values relate to one another? This information can be calculated in the worksheet.

To display basic statistical information for one column:
1. Click on the header B to select all of Column B: Site A.
2. Click the **Cells | Data | Statistics** command.
3. In the dialog, check the items that should be displayed. For instance, if we are interested in the highest value, we would check *Maximum*. Since we are interested in the highest value and average values, Check *Maximum* and *Mean*.
4. Click **OK** and the information is displayed in a small report window.
5. We can note that the *Maximum* value is 62.7 for this site and the *Mean* is 54. Click **Close** to close the report window.

To compare multiple site average values and compare confidence in the values, we could click on each column separately or we could display all of the information at once. To display all of the information at once:
1. Click on the header B and hold down the left mouse button. Drag the mouse across all columns until column I is highlighted. All *Site* columns are now selected.
2. Click the **Cells | Data | Statistics** command.
3. In the dialog, check the items that should be displayed. In this case, we are interested in the highest value, average values, and confidence in the average values. Check *Maximum*, *Mean*, *Standard error of the mean*, and *95% confidence interval for the mean*.
4. Select *Copy to worksheet* and set the *Starting in cell* to K1 to display the summary information in the same worksheet as the actual data instead of in a report window.
5. Click **OK** and the information is displayed in columns K through S.
6. Mean values can be compared visually. The standard error of the mean and 95% confidence value can also be compared. In addition, plots can be created directly from the summary statistics information, if desired.

**Creating a New Data File**

The **Grapher** worksheet can also be used to create a new data file. Use these steps to open a new worksheet window and begin entering data.

1. Click the **File | New | Worksheet** command, click the button in the quick
access toolbar, or press CTRL+W on the keyboard. A new empty worksheet window is displayed.

2. Data are entered into the active cell of the worksheet. The active cell is selected by clicking on the cell or by using the arrow keys to move between cells. When a cell is active, enter a value or text, and the information is displayed in both the active cell and the active cell edit box.

3. To preserve the typed data in the active cell, move to a new cell. Move to a new cell by clicking a new cell with the mouse, pressing one of the arrow keys, or pressing ENTER.

Refer to the Worksheet Window section on page 14 of this guide for information about the various portions of the worksheet window.

Saving the Data File

When you have completed entering all of the data, the data can be saved in a variety of formats. Data cannot be saved in the demo version.

1. Click the File | Save command, click the button on the quick access toolbar, or press CTRL+S on the keyboard. The Save As dialog is displayed if you have not previously saved the data file.

2. In the Save as type list, choose the DAT Data (*.dat) option.

3. Type the name of the file in the File name box.

4. Click the Save button and the Data Export Options dialog opens.

5. Accept the defaults in the Data Export Options dialog by clicking OK.

6. The file is saved in the Data .DAT format with the file name you specified. The name of the data file appears in the title bar and on the worksheet tab.

Lesson 2 - Creating a Graph

You can create graphs in several ways in Grapher. The various methods are discussed in the Creating Graphs section on page 19 of this quick start guide. In the tutorial, we use the most common method, creating a graph through the Graphs tab Create group. We will create a line plot from an existing data set.

To create a line plot:

1. If the worksheet window is still open, click on the Plot1 tab. Alternatively, you
can create a new plot window by clicking the File | New | Plot command.

2. Click the Graphs | Create | Basic command and select the Line Plot button.

3. In the Open Worksheet dialog, select the Tutorial. dat samples file. You can select the file in the file list section or in the Open worksheets section at the bottom of the dialog.

4. Once the file is selected, click Open.

A line plot is created using the default properties. By default, Grapher uses the first two columns containing numeric or date/time data in the data file. So, X is column A and Y is column B.

Lesson 3 - Modifying Plot Properties

You can edit any of the plot properties after the graph has been created. You can edit the columns used to create the plot, the plot line color, the symbol display, label display, add fill to the plot, or just about anything you see on the plot. In this example, let's change the line plot created in the Lesson - 2 Creating a Graph section to a scatter plot and add labels. The graph from Lesson 2 - Creating a Graph should already exist in the plot window before you proceed with this lesson.

Selecting the Line/Scatter Plot

The Object Manager is the easiest way to select an object, so this method is used throughout the rest of the tutorial. Methods for selecting objects are discussed in detail in the online help topic, Selecting Objects. Once an object is selected, its properties are available for editing in the Property Manager.

To select the line/scatter plot:

1. Make sure the Object Manager is open. If you do not see the Object Manager, check the box next to the View | Display | Object Manager command. A check mark is displayed next to the visible managers.

2. In the Object Manager, left-click the Line/Scatter Plot 1 object. This selects the line/scatter plot and opens the line/scatter plot properties in the Property Manager.
Changing the Line/Scatter Plot Properties

The **Property Manager** contains all of the properties for the selected object on multiple pages. A line/scatter plot contains **Plot**, **Clipping**, **Error Bars**, **Labels**, **Symbol**, **Line**, and **Fill** tabs. Click the tab name to open that property page.

You may need to click on the + or - buttons next to section names to access the properties as discussed in the **Property Manager** section on page 10 of this quick start guide.

Changing the Line Plot to a Scatter Plot

If the **Graphs | Create | Basic | Scatter Plot** command had been originally clicked, a scatter plot would have been created. Any line plot can be changed to a scatter plot or a scatter plot to a line plot by changing the plot properties. A quicker method is discussed in the **Changing the Plot Type** section on page 35. The method discussed here allows other properties to be changed, if desired.

To change the line plot to a scatter plot:

1. In the **Property Manager**, click on the **Symbol** tab to edit the symbol properties.
2. Next to the **Symbol frequency** option, click the up arrow once. Alternatively, highlight the number 0, type the number 1, and press ENTER on your keyboard. The plot is updated with the default symbol at every data value.
3. The current symbol is located next to **Symbol**. Click the current symbol, which by default is a . Clicking on the current symbol opens the symbol palette. Click the filled square, symbol **Number 10**, two boxes to the left of the default symbol. Once you click on the filled square, the symbol palette closes and the plot automatically updates to show the new symbol.
4. Click on the **Line** tab to edit the line properties.
5. Click on the current line style, next to the **Style** option, to open the line style palette. Click on the invisible line style, which is the second entry in the list. Once you click on the invisible line style, the line style palette closes and the plot changes to a scatter plot.

Create the scatter plot by adding symbols and setting the line Style to invisible.
Displaying Plot Labels
Labels can be displayed at any data point on the plot. Labels can come from the X or Y data columns or from any other data column in the worksheet. To display labels for the data points:
1. Click on the Line/Scatter Plot 1 in the Object Manager.
2. In the Property Manager, click on the Labels tab to display the plot label properties.
3. Check the box next to the Display labels option.

The Y data values are shown as labels to the data points on the plot. By default, the column used for the labels is the Y data column, although you can uncheck the box next to the Labels in Y column option and set the Column to any worksheet column to display the label from that column. This is useful when you are wanting to display point names or IDs.

Moving Labels
Grapher allows you to manually move labels that are displaying for plots and axes. In addition, you can move axis and graph titles.
1. With the plot selected, click on the Graphs | Plot | Move Labels command.
2. The first label will appear with a box around it, like: .
3. Click on the label, hold down the left mouse button, and drag the label to the desired location. Alternatively, press the ARROW keys on the keyboard to move the label a small amount.
4. When you are finished moving this label, click on another label to move it. Repeat the clicking on labels and moving until all labels are in the desired location.
5. When finished, press the ESC key on the keyboard to end moving labels mode.

To return the labels to their original position, click the Reset button next to the Reset positions option on the Labels tab for a plot or the Tick Labels tab for an axis.

Lesson 4 - Editing Axes
Grapher's axes can be modified to fit any design needs. The axis scale, axis length, tick mark spacing, tick labels, axis titles, colors, etc. can all be customized.
Selecting the Axis
The graph from Lesson 2 - Creating a Graph should already exist in the plot window before proceeding with this lesson. Click on the Y Axis 1 in the Object Manager to display the axis properties in the Property Manager.

Adding an Axis Title
Once the axis is selected, all of the axis properties are displayed in the Property Manager. Standard axes, such as the selected Y Axis 1, have Axis, Grid Lines, Tick Marks, Tick Labels, Break Axis, Link Axis, and Line tabs. The axis title options are on the Axis tab.

To add an axis title:
1. Click the Axis tab in the Property Manager to edit the axis properties.
2. Open the Title section by clicking the next to Title, if necessary.
3. In the Title section, click the Editor button next to the Title option. The Text Editor opens.
4. In the Text Editor, type the words Temperature (F).
5. Click in the space just before the F and click the button.
6. In the Symbol Properties dialog, change the Symbol Set to Arial and select the degree symbol, symbol Number 144. Click OK to return to the Text Editor. Alternatively, you can click in the space before the F and press and hold the ALT key. Type the number 0176. This will also insert the symbol, without opening the Symbol Properties dialog. This is a good method to use when inserting Unicode or international characters in any text box.
7. Next, let's change the properties of the axis title. In the Text Editor, highlight the text Temperature (°F).
8. Highlight the current font size and type 18, to make the font 18 points. The font size is located to the right of the font name in the upper left corner of the dialog. Only the highlighted text changes size, so be sure to select all of the text.
9. Click OK to close the Text Editor and save the axis title.

The text Temperature (°F) now appears along the Y axis. Use this same procedure to add the title Month to the X Axis 1.
**Changing the Tick Mark Spacing**

Tick marks are a means of indicating units of measure and are typically equally spaced like the lines on a ruler. Tick marks are the lines that emerge perpendicularly from an axis. Normally, the major tick marks are longer and the minor tick marks are shorter and appear between the major tick marks. In the graph created in Lesson 2 - Creating a Graph, the major tick mark spacing on the Y axis is five units, i.e., 40, 45, 50, 55, 60, and 65. In addition, there is a single unlabeled minor tick mark between each set of major tick marks. In the following exercise, the tick spacing is changed to ten units. The number of minor tick marks is changed to five.

To change the tick mark spacing:
1. Click on the Y Axis 1 in the Object Manager to select it.
2. In the Property Manager, click on the Tick Marks tab.
3. Click the next to Major Ticks, if necessary.
4. Change the Spacing from 5 to 10. To change the Spacing, highlight the existing number 5, type the new number 10, and press ENTER on your keyboard.
5. Click the next to Minor Ticks, if necessary.
6. Change the Divisions from 2 to 5. To change the Divisions, highlight the existing number 2, type the new number 5, and press ENTER on your keyboard.

The Y Axis 1 tick mark spacing changes to ten in the plot window and additional minor tick marks are added. In addition, the axis limits automatically adjust so that an even number of tick marks are displayed on the axis. Apply this same procedure to the X axis, changing the major tick mark Spacing from four to one and the Divisions to 1, so no minor tick marks are displayed.

**Changing the Tick Labels**

Tick labels can be displayed using different label sources including Automatic, Date/Time, and From worksheet. Automatic labels are the default, however there may be situations where either using a number to represent date/time values or labels directly from a worksheet source may be useful. For this tutorial, we will change the X axis labels to use a data column from the worksheet where we have tick label names specified.

To change the tick labels source:
1. Click on the X Axis 1 in the Object Manager.
2. In the Property Manager, click on the Tick Labels tab.
3. Click the next to the Major Label Text section, if necessary.
4. Click on the word *Automatic* next to the *Label source* option. In the drop-down list, select *From worksheet*. This activates the *Worksheet* option.

5. Next to *Worksheet*, click the word *None* to display a drop-down list of open worksheets and the *Browse* option. The *Browse* option would be used to select a worksheet that is not already open. In this tutorial, the worksheet we want to use is already open. Select the *Tutorial.dat* file from the list.

6. Next to the *Data column* option, click the existing column and select *Column A: Month*.

7. Next to the *Label column* option, click the existing column and select *Column J: Month Name*.

The graph updates with the worksheet labels defined by the text in column J of the worksheet.

If the axis labels or the axis title overlap or need to be moved slightly, click the **Graphs | Plot | Move Labels** command. Click on the label or axis title, hold down the left mouse button, and drag the label or title to the new location. For example, in the graph to the right, the first plot label was moved. Press ESC on the keyboard when all of the labels are in the desired location.

**Adding Grid Lines**

Grid lines make it easier to see how the data relate to the axes. You can add grid lines at major tick marks, minor tick marks, or at values specified in a data file. All of the line properties such as color, width, and style can also be edited for each type of grid line separately.

If you are making the same change to multiple objects, all of the items can be selected and edited at the same time. Since we want grid lines on both axes, we can select both axes and add grid lines at the same time.

To add grid lines to both axes:

1. In the **Object Manager**, click on *X Axis 1*, hold down the CTRL key on your keyboard, and click on *Y Axis 1*. Both axes are selected.

2. Note the **Property Manager** shows only those properties common to all selected objects when multiple objects are selected. Since both objects are axes, all of the axis properties are displayed. Click on the **Grid Lines** tab to open the grid line
properties.
3. Click the next to Major Lines, if necessary.
4. Check the box next to the At major ticks option. Grid lines appear on both axes on the graph.
5. Click the next to Major line properties, if necessary.
6. Click on the current color next to the Color option. In the color palette, click on the 20% Black color, which is the color directly below Black. Once you click on the 20% Black color, the palette closes and the axes grid lines update with the new color.

Lesson 5 - Adding Additional Plots to the Graph

You can add several plots to one graph in Grapher. In Tutorial.dat, columns B through I are additional Y data, making it simple to add additional plots to the graph.

Adding a New Plot to an Existing Graph
1. Click on Line/Scatter Plot 1 in the Object Manager.
2. In the Property Manager, click on the Plot tab.
3. Click the Create button next to the New plot option.

Clicking the Create button creates a new line/scatter plot using the same worksheet as the original plot. The same axes and plot properties are also used for the new plot. The X column stays the same and the Y column increments to the next column with data. The new plot is selected after the command is executed. The Property Manager title changes to Property Manager - Line/Scatter Plot 2 and the Y column changes to Column C: Site B.

All of the data must be contained in one data file to use the New plot feature. In addition, not all plot types have this option. When many plot types are selected, the Graphs | Add to Graph commands are available. These allow additional axes, plots from a different data file, legends, summation plots, duplicate axes, and magnifiers to be added to the selected graph. For additional information on these command, see the Plot - Add to Graph topic in the Plots book in the Graph Features book in the online help.
Changing the Plot Type

Let's change the new scatter plot into a line plot to help differentiate between the two curves. Previously, we changed from a line plot to a scatter plot by editing the Line and Symbol properties in the Property Manager. There is also a shortcut to changing between plot types.

To change a scatter plot into a line plot:
1. Click on the Line/Scatter Plot 2 in the Object Manager.
2. Click the arrow next to the Graphs | Plot | Change Plot To command. Select Line from the list. The scatter plot changes to a line plot.
3. To remove the labels, click on the Labels tab in the Property Manager.
4. Uncheck the box next to the Display labels option.

The Graph | Change Plot To command is not available for all plot types. It can be used to convert line, scatter, line/scatter, step, and bar charts to other line, scatter, line/scatter, step, and bar charts. It can also be used, when the entire graph is selected, to convert a 2D graph to a 3D graph, or vice versa.

Adding Semi-Transparent Fill to the Line Plot

Adding a semi-transparent fill to the line plot will help distinguish it from the scatter plot. To add fill to the line plot:
1. Click on the Line/Scatter Plot 2 in the Object Manager, if it is not already selected.
2. Click on the Fill tab in the Property Manager to display the fill properties.
3. Next to Foreground color, click the current color and select Yellow from the color palette.
4. Next to Foreground opacity, highlight the existing value, type 50, and press ENTER on the keyboard. Alternatively, drag the slider to the left until it is at 50%. The line plot is now filled with semi-transparent yellow.

Lesson 6 - Editing Graph Properties

Graph properties control settings that affect the entire graph, such as titles, background line and fill colors, and fill patterns that fill between multiple plots. Let’s add a graph title and set the background fill and line properties for the graph.
Adding a Graph Title

To add a graph title:
1. Click on the Graph 1 object in the Object Manager to select the entire graph.
2. In the Property Manager, click on the Title tab.
3. Click the Editor button next to the Title option.
4. In the Text Editor, type the graph title, Research Results.
5. Highlight all of the text.
6. Highlight the existing font size and change it to 20.
7. Click OK and the title appears on the graph.
8. By default, the title contains a box around it. To turn off the display of the box, click the next to the Box Line Properties section, if necessary.
9. Click on the line sample next to Style and select the invisible line. When you select the invisible line, the graph title automatically updates.

Setting Background Fill and Line Properties

To set the background fill and line properties:
1. With the Graph 1 selected, click on the Background tab in the Property Manager.
2. Click the next to the Background line section, if necessary.
3. Click on the line sample next to Style and select the solid line, the first option.
4. Set the Width of the line by highlighting the number next to Width, typing a new value, and pressing ENTER on the keyboard. Set the Width to 0.020 inches.
5. Click the next to the Background Fill section, if necessary.
6. Set the Foreground color to Pale Yellow by clicking on the existing color and selecting the Pale Yellow color from the palette.

The graph now has a light yellow background, all axes and the graph are labeled.
Lesson 7 - Adding and Editing a Legend

Legends provide information for interpreting a graph. You can add a legend for most plot types. Typically, legends are linked to the graph so that any changes made to the graph are automatically updated in the legend. The legend features, such as font and legend placement, can be customized.

Adding a Legend
To add a legend:
1. Select any part of the graph by clicking on an object in the graph, such as Y Axis 1 or Line/Scatter Plot 2.
2. Click the Graphs | Add to Graph | Legend command.

A legend is created for the graph using the default properties. These properties can be changed. Currently, the legend displays Graph 1 for the title and Line/Scatter Plot 1 and Line/Scatter Plot 2 for the plot names. Let's move the legend, and change the names to reflect the data.

Moving the Legend
To move the legend:
1. Click on Legend 1 in the Object Manager to select the legend.
2. Once the legend is selected, position the cursor over the legend in the plot window, click and hold the left mouse button.
3. Drag the legend to a new location and release the mouse button.

Editing the Legend Title
To change the legend title:
1. Click on Legend 1 in the Object Manager to select the legend.
2. In the Property Manager, click on the Legend tab.
3. Click the Editor button next to Title. This opens the Text Editor and allows you to edit the legend title.
4. In the Text Editor, highlight Graph 1 and type the title Site Location Key.
5. Click OK and the legend is updated.

Editing the Plot Names
To change the plot names in the legend:
1. Click on Legend 1 in the Object Manager to select the legend.
2. In the Property Manager, click on the Legend tab.
3. Next to the *Entries* option, click the *Edit* button. The **Legend Entries** dialog opens.
4. In the **Legend Entries** dialog, click *Line/Scatter Plot 1* under the *Name* column and click the *Rename* button. The **Text Editor** opens.
5. Let's change the text to *Site A* to match the worksheet. Highlight *Line/Scatter Plot 1* and type *Site A*.
6. Click *OK* to close the **Text Editor**.
7. In the **Legend Entries** dialog, click *Line/Scatter Plot 2* under the *Name* column and click the *Rename* button. The **Text Editor** opens.
8. Another way to change the text is to link the text to a worksheet cell. Highlight the *Line/Scatter Plot 2* text and press the DELETE key on your keyboard.
9. Click the **Worksheet** button.
10. In the **Open Worksheet** dialog, click the *Tutorial.dat* file and click *Open*.
11. Click the **Insert cell...** button.
12. In the **Enter Cell** dialog, type *C1* and click *OK*. The text <<@C1>> will be displayed in the **Text Editor**, indicating linked worksheet text.
13. Click *OK* in the **Text Editor**. The *Line/Scatter Plot 2* is updated to *Site B*. This text will automatically update if the text in cell C1 of the worksheet changes.
14. Click *OK* to close the **Legend Entries** dialog. The legend updates with the modified names.

**Changing the Number of Symbols**
The number of symbols in a legend can be set from 0 to 3. To change the number of symbols:
1. Click on *Legend 1* in the **Object Manager** to select the legend.
2. In the **Property Manager**, click the **Legend** tab.
3. Click on the number 3 next to the *Number of symbols* option and select 1 from the list. The legend is updated displaying only one symbol.

**Changing the Symbol Size**
To change the symbol size to match that of the symbols on the plot:
1. Click on *Legend 1* in the **Object Manager** to select the legend.
2. In the **Property Manager**, click the **Legend** tab.
3. Click the *Edit* button next to the *Entries* option. The **Legend Entries** dialog opens.
4. Select the *Site A* in the *Name* column and click the *Symbol Size* button. The **Symbol Size** dialog opens.
5. Change the *Size* from *Fixed* to *Plot size*.
6. Click *OK* to return to the **Legend Entries** dialog.
7. Click *OK* in the **Legend Entries** dialog. The symbol size in the legend now matches
the symbol size in the plot.

**Changing the Line Length**

In addition to changing the number and size of the symbols, the length of the displayed line can be changed. To change the line length:

1. Click on *Legend 1* in the **Object Manager** to select the legend.
2. In the **Property Manager**, click the **Legend** tab.
3. Highlight the value next to the *Line length* option. Type the new value of 0.5 and press ENTER on the keyboard. The line next to *Site B* is shortened to 0.5 inches.

**Adding a Drop Shadow**

To add a shadow behind the legend:

1. Click on *Legend 1* in the **Object Manager** to select the legend.
2. In the **Property Manager**, click the **Legend** tab.
3. Check the box next to the *Display shadow* option and a shadow is added behind the legend.

**Creating Multiple Columns in the Legend**

Longer legends may need to be split into multiple columns to make the best use of the page space. To separate a legend into multiple columns:

1. Click on *Legend 1* in the **Object Manager** to select the legend.
2. In the **Property Manager**, click the **Legend** tab.
3. Highlight the value next to the *Number of columns* option. Type a new value, such as 2, and press ENTER on the keyboard. The legend is updated to show the new number of columns.

**Lesson 8 - Working with the Script Recorder**

**Scripter** is Golden Software’s automation program. You may record your actions in **Grapher** with the **Script Recorder** rather than writing the scripts manually in **Scripter**. Detailed information about automation is located in the online help **Grapher Automation** book.

The **Script Recorder** can be used for many tasks. We will provide one scenario to demonstrate the **Script Recorder**. For example,
Grapher

Let's say you receive a data file once a quarter. The file has the same file name each quarter and the same number of columns, but the information contained in the file updates each time. Each quarter you need to create the graph and export it for use in your quarterly reports. You can automate this process with the **Script Recorder** to save time and increase efficiency.

The graph in this example is fairly simple for time's sake, but keep in mind that complex graphs are very well suited to automation. We will record the process of creating a graph, changing some features of the graph, and exporting the graph. The creation of this graph uses the features included in the previous lessons and includes a few new items. If you do not understand part of the directions, review the material in the previous lessons or consult the online help.

**Opening the Script Manager**

The **Script Manager** can be used to view scripts as they record. Check the box next to the **View | Display | Script Manager** command to display the **Script Manager**. A check mark is displayed next to visible managers. By default, the **Script Manager** is located at the bottom of the **Grapher** window, tabbed with the **Worksheet Manager**. Click the **Script Manager** tab to view the **Script Manager**.

**Developer Tab**

The **Developer** tab in the ribbon is used to start and stop recording scripts. Help for **Grapher** automation and Basic Language help information can also be accessed on the **Developer** tab.

**Start Recording**

Click the **Developer | Recorder | Record** command to start recording. The button changes color from bluish green to red and the word **Record** changes to **Stop** to indicate that the script is recording. Information appears in the **Script Manager** as soon as recording begins. This code starts **Grapher** when the script is run later. Every action taken will be recorded in the **Script Manager** until the recording is stopped.

**Opening a New Plot Window**

Let's open a new plot window to start. Click the **File | New | Plot** command to create a new plot window.

**Creating a Line Plot**

To create the line plot:

1. Click the **Graphs | Create | Basic** command and select the **Line Plot** button.
2. The Open Worksheet dialog appears. Browse to Grapher's Samples folder. If the software was installed in the default folder, the path is C:\Program Files\Golden Software\Grapher 11\Samples.
3. Click the tutorial script recorder.xls file and click Open to create the default graph.

A 2D line plot is created with the first two available columns using the default properties. Grapher can create graphs from data containing date/time information. In this example, column A contains dates so dates are plotted on the X Axis.

Changing the X Axis Date/Time Limits
The axis limits can use the default limits or can be changed to show only a portion of the graph. Limits can be based on numerical values or on date/time values. To change the X Axis limits using date/time values:
1. Select the X Axis 1 in the Object Manager.
2. In the Property Manager, click on the Axis tab to display the axis properties.
3. Click the + to the left of the Limits section to expand the axis limits.
4. Click the button next to the 12/18/08 value next to Minimum date/time to open the Select Date Time dialog.
5. Change the Date to 1/1/2009 and click OK.
6. Dates can also be edited directly in the Property Manager. Highlight the 3/28/09 value next to Maximum date/time and type 4/1/2009 and press ENTER.

The X Axis limits now range from 1/1/09 to 4/1/09.

Changing the X Axis Date/Time Tick Mark Spacing
Tick marks can be spaced at any desired interval. Tick marks can be changed to show one tick mark every X number of units or can be based on date/time units, such as minutes, days, months, or years. To set the tick marks to display one tick and label spacing per month:
1. Select the X Axis 1 in the Object Manager.
2. In the Property Manager, click on the Tick Marks tab to display the tick mark properties.
3. Click the + to the left of the Major Ticks section to expand the major tick options.
4. Check the box next to the Use date/time spacing option.
5. Next to Date/time spacing, click Every Year to open the Date/Time Spacing...
Grapher

dialog.
6. Change Year to Month and click OK.

The X Axis major tick marks are displayed as 1/1/09, 2/1/09, 3/1/09, and 4/1/09.

**Changing the X Axis Date/Time Tick Label Format**
There are a variety of tick label formatting options available. One of the options is to change the display of the date/time labels. There are many different predefined date/time labels available or you can create your own custom format.

To change the major label format from M/d/yy (1/1/09) to MMM-yy (Jan-09):
1. Select the X Axis 1 in the Object Manager.
2. In the Property Manager, click on the Tick Labels tab to display the tick label properties.
3. Click the next to Major Labels to expand the major label options.
4. Click the next to Format to expand the label format section.
5. Click the Select button next to Date/time format to open the Date/Time dialog.
6. Click on the M/d/yy to display the list of available formats. Select MMM-yy from the list.
7. Click OK.

The X Axis tick labels are displayed as Jan-09, Feb-09, Mar-09, and Apr-09.

**Adding X Axis Grid Lines**
Grid lines make it easier to determine the data values on a graph. There are many options for grid lines, such as showing the grid lines at major ticks, minor ticks, or at values defined in a worksheet.

To add grid lines to the X Axis:
1. Select the X Axis 1 in the Object Manager.
2. In the Property Manager, click on the Grid Lines tab to display the grid line properties.
3. Click the next to Major Lines to open the major grid line section.
4. Check the box next to At major ticks.
5. Click the to the left of Major line properties to
expand the major line properties.

6. Next to Color, click Black to open the color palette and select 20% Black. The color palette automatically closes with the new line color selected. 20% black grid lines are added to the graph at the major ticks.

Adding Linked Text to the Graph Title

It would be a good idea to add text explaining the information contained in the graphs. In this file, cell A1 contains the data's time range, January through March 2009. The next quarter's data file will contain April through June 2009. With linked text, the information is updated on the graph any time the information changes in the cell in the data file. When the script is run, the date in the data file appears on the graphs.

To add linked text information to the graph title:

1. Select Graph 1 in the Object Manager.
2. In the Property Manager, click the Title tab to open the graph title properties.
3. Next to Title, click the Editor button to open the Text Editor.
4. Click the button to select the worksheet that contains the text.
5. In the Open Worksheet dialog, select the tutorial script recorder.xls file from the Open worksheets section and click Open.
6. Click the button in the Text Editor. Type A1 into the Enter Cell dialog and click OK. <<@A1>> appears in the Text Editor.
7. Highlight all of the text in the Text Editor. Change the size of the text to 24 by highlighting the existing value and typing 24 in the font size box. The size box is located to the right of the font name.
8. Change any other properties, such as text color, if desired.
9. Click OK in the Text Editor to close the dialog and apply the changes.

Although we could add many more features to the graph, we will stop here. Additional features may be added now if you like.

Exporting the Graph

Since the graphs are used to create a report, the graph must be exported for use in another program.

To export the graph:

1. Click the Home | IO | Export command.
2. Type tutorial script recorder into the File name field in the Export dialog.
3. Select PDF (Vector) (*.pdf) from the Save as type list.
4. Check the Show options dialog box. Checking this option enables you to make any changes in the exported options.
5. Uncheck the *Use graph coordinates for export (when applicable)* box. The *Use graph coordinates for export (when applicable)* exports the graph using graph coordinates. For reports and images, it is best to have this option unchecked.

6. Uncheck the *Selected options only* box. The *Selected options only* option only exports the items that are currently selected in the graph window.

7. Click the *Save* button.

8. In the **Export Options** dialog, click on the **Vector PDF Options** tab.

9. Check the *Use application page size (if applicable)* box. This exports the entire page, not just the graph.

10. Check the *Compress images* and *Compress pages* boxes to make the file size as small as possible.

11. Click *OK* and the PDF file is created.

**Stopping and Saving the Script**

Now that the graph has been created, it is time to stop recording and save the script.

To stop recording and save the script:

1. Click the **Developer | Recorder | Stop** command.
2. In the **Save As** dialog, type *tutorial script recorder* into the *File name* box.
3. Click the *Save* button.
4. Right-click in the **Script Manager** and click **File | Close** to close the script in the **Script Manager**.

The recording is stopped and the *tutorial script recorder.bas* is saved for future use.

**Running Scripts within Grapher**

Assuming the file name is the same each time; the graphs are automatically created and updated each time the script is run. The script can be run from **Scripter** or from the **Script Manager** in **Grapher**. In our tutorial scenario, when you receive the next set of data, with the same file name, run the script to produce the needed graph. To run the script within **Grapher**:

1. Click the **Developer | Recorder | Run** command.
2. Click on *tutorial script recorder.bas* in the **Open** dialog and click *Open*. You can watch the graph as it is created.
Running Scripts from Scripter

Scripts can also be run from **Scripter**.

To run the script from **Scripter**:
1. Click on the Windows Start button.
2. Open the program list, select **Golden Software Grapher 11**, and click the **Scripter** link.
3. Click the **File | Open** command.
4. In the **Open** dialog, select the *tutorial script recorder.bas* file and click **Open**.
5. Click the **Script | Run** command or click the button to start the script.

Automation Help

Advanced users needing help in **Scripter** can use the **Developer | Help | Grapher Automation Help** command for specific information about *Grapher’s* objects, methods, and properties. Click the **Developer | Help | BASIC Language Help** command for information about BASIC commands. Or, click the **Help | Contents** command in **Scripter** for information about the **Scripter** program.

Printing the Online Help

The online help topics may be printed. You can print a single topic, a section of the table of contents, or all topics in the table of contents. Open the online help by clicking the **Home | Help | Contents** command in the **Grapher** window.

To print one topic, click the topic you wish to print and click the button. If the **Contents** page is open in the help navigation pane, the **Print Topics** dialog appears. Select *Print the selected topic* and click **OK**.

To print one book, the **Tutorial** for example, click the **Contents** tab on the left side of the help window. Expand the **Grapher 11** book and click on the book you want to print, such as the **Tutorial** book, to select the book. Click the button. In the **Print Topics** dialog, select *Print the selected heading and all subtopics* and click **OK**. All the topics included in the **Tutorial** book are printed.

To print all of the topics in the help file table of contents, select the top-level book in the help book, **Grapher 11**. Click the button. In the **Print Topics** dialog,
select *Print the selected heading and all subtopics* and click OK. All the topics included in the online help table of contents are printed.

WARNING: Printing the entire help file takes hundreds of letter-sized sheets of paper and is very time consuming. There is no table of contents or index printed with the file.

You can purchase the full PDF user’s guide that includes all of the documentation for the program. This PDF user’s guide can be printed by the user, if desired. The guide can be purchased on the Golden Software website at www.GoldenSoftware.com.

**Getting Help**

The quick start guide is a quick way to learn about the basics in Grapher. There are also other sources of help with Grapher.

**Online Help**

Extensive information about Grapher is located in the online help. Click the *Home | Help | Contents* command to access the online help. You can navigate the online help using the *Contents, Index, Search,* and *Favorites* tabs on the navigation pane to the left of the topic page.

**Context-Sensitive Help**

Grapher also contains context-sensitive help. Highlight a window, manager, or dialog and press the F1 key to display help for the highlighted item. In addition, most dialogs contain a help button. Click the ![?] button in a dialog title bar to open the help topic for the displayed properties.

**Internet Resources**

There are several internet help resources.

- Direct links to the Golden Software home page (www.GoldenSoftware.com), main Grapher product page, frequently asked questions, knowledge base, and forums are available by clicking the *File | Online* commands.
- The *File | Feedback* commands send a problem report, suggestion, or information request by email directly to Grapher technical support.
- Click the *Forums* button in the online help (Home | Help | Contents command) to post a question to our public support forums.
- Click the *Knowledge Base* button in the online help to search for an answer in our frequently updated knowledge base.
Quick Start Guide

- Read through our blog items at www.GoldenSoftware.com/blog.

Technical Support

Golden Software’s technical support is free to registered users of Golden Software products. Our technical support staff is trained to help you find answers to your questions quickly and accurately. We are happy to answer all of your questions about any of our products, both before and after your purchase. We also welcome suggestions for improvements to our software and encourage you to contact us with any ideas you may have for adding new features and capabilities to our programs.

Technical support is available Monday through Friday 8:00 AM to 5:00 PM Mountain Time, excluding major United States holidays. We respond to email and fax technical questions within one business day.

When contacting us with your question, have the following information available:
- Your Grapher serial number (located on the CD shipping cover or in the File | About Grapher dialog)
- Your Grapher version number, found in File | About Grapher
- The operating system you are using (Windows XP, Vista, 7, 8, or higher)
- Whether you are using a 32-bit or 64-bit Grapher program and operating system

If you encounter problems with Grapher, you are welcome to send an email message to Golden Software using the File | Feedback | Problem Report command. This message is delivered directly to GrapherSupport@GoldenSoftware.com. Report the steps you perform when the problem occurs and include the full text of any error messages that are displayed. You are welcome to attach a .ZIP file (10 MB maximum) containing the .GRF, .GPJ, or data files that illustrate the problem. Contact technical support for other arrangements if you have very large zipped attachments to send.
